How do disasters exacerbate gender inequalities?
Does gender influence how access to resources are affected by different hazards?
How does gender intersect with other socio-economic characteristics to shape people's unique vulnerability?

As the world is grappling with the challenges brought about by the COVID-19 pandemic, building resilience is more important than ever. Yet the impact of disasters, whether caused by viruses or natural hazards, is not felt uniformly by everyone. Understanding how gender relations shape lives is critical to reducing disaster risk.

Join us for a discussion on how an intersectional gender-responsive approach can reduce disaster risk.
